## LUMMI ISLAND WILD

Lummi Island Wild's flagship reef net fishery is the first solar powered fishery. It is recognized as one of the most sustainable fisheries on the planet due to its low carbon footprint. After a successful catch, reef net salmon are gently rolled into a live well, giving them an extremely high success rate for releasing non-targeted species unharmed back into the wild. Lummi Island Wild uses recyclable packaging materials and carbon neutral shipping programs to help measure and manage carbon emissions.
